Home Therapy Scheme for Ankle Fractures

This information is for patients who are undergoing ‘Home Therapy’ whilst awaiting surgery

Author: Orthopaedic Therapy Team
Date: June 2014
Review date: June 2016
Version: 2
What is Home Therapy?

Surgery to fix a broken ankle is often delayed several days due to swelling. Rather than staying in hospital, it is possible to wait in the comfort of your own home until the swelling goes down.

‘Home Therapy’ involves resting the ankle in high elevation to reduce the swelling. The therapy team will phone you initially to discuss any problems you may be having and ensure you are coping at home. If any further advice is required you will be able to contact the therapist over the phone.

Am I eligible for this service?

The Orthopaedic team will assess if you are suitable for home therapy for which you must meet the following criteria;

- Medically fit for discharge home
- Safe mobilising non weight bearing
- Safe on stairs (if required)
- Independent in activities of daily living
- Telephone at home
- Inside toilet facilities
- Live within 1 hour drive of the hospital
- Food/drink available at home
- Able to comply with home ice and elevation
- No history of thrombus (DVT)
Your operation

“We must by law obtain your written consent to this procedure beforehand. Staff will explain all the risks, benefits and alternatives before asking you to sign a consent form. If you are unsure about any aspect of the treatment proposed, please do not hesitate to speak with a senior member of staff.”

Elevation

- It is important that you keep your leg elevated as much as possible, preferably with your ankle above the level of your heart. We suggest using at least 4 pillows.
- You may mobilise to the toilet or for essential journeys (i.e. to make a drink) using the crutches/frame as taught by the therapist. At all other times we recommend that you keep your ankle elevated.

Ice

If instructed to do so place an icepack over the ankle for 20 minutes, with your foot elevated. Repeat every hour where possible. Please ensure you do not get the plaster wet. People who are sensitive to cold or have circulatory problems need to be wary when using ice treatment.
Pain Control

It is important that your pain is well controlled. Make sure you take your painkillers regularly. Seek advice from your GP if your pain is not controlled for review of your medication.

Complications

There is a small risk after a fracture that the fracture could move or you could develop a blood clot, blister or compartment syndrome.

Seek advice if:

- The plaster is rubbing or digging into your skin
- You experience numbness or pins and needles in your toes
- There is increased swelling
- Your toes go blue or white
- You experience severe pain
- There is discharge through the plaster
Exercises

We recommend that you perform the following exercises regularly:

1. **Toe flexion/extension**
   - Bend and straighten your toes in the cast.
   - Repeat 10 times.

2. **Static quads**
   - Brace your knee back tightening your thigh muscles. Hold for 5 seconds then relax.
   - Repeat 10 times.

3. **Straight leg raise**
   - Raise your leg up off the bed keeping your knee straight. Hold for 5 seconds then slowly lower.
   - Repeat 10 times.
